

SANISA

Retention Intelligence Platform™

Product & Pilot Concept Document

Turning customer frustration into retention.

Prepared by Sanisa Collective

1. Platform Overview

The **Sanisa Retention Intelligence Platform™** is a cloud-based customer retention and service recovery platform designed to help organisations identify frustrated customers, assess retention risk, and determine the most appropriate intervention to protect the customer relationship.

The platform uses **customer frustration, customer value, service interactions, resolution performance and behavioural data** to recommend intelligent recovery actions — including personalised loyalty rewards.

Core Principle

“Loyalty begins after the complaint.”

The platform does not simply ask whether a customer's problem was resolved. It asks: **What is this customer worth, how frustrated are they, what is their likelihood of leaving, and what intervention gives us the best chance of retaining them?**

2. The Retention Intelligence Loop

Customer Frustration → Data Capture → Frustration & Value Analysis → Retention Risk Assessment → Recommended Intervention → Service Recovery → Intelligent Loyalty Reward → Customer Feedback → Retention Outcome → Data Feeds Back Into Engine

This creates a system where every customer interaction can contribute to better retention decisions.

3. Core Platform Engines

Engine	Purpose
Frustration Intelligence Engine	Measures customer frustration using complaints, sentiment, interaction frequency, escalation and resolution delays.
Customer Value Engine	Determines the commercial/relationship value of a customer based on available customer and product data.
Retention Risk Engine	Identifies customers who may be at risk of disengagement or churn.
Retention Decision Engine	Determines the appropriate recovery intervention based on customer value, frustration and risk.
Loyalty Recovery Engine	Delivers personalised loyalty incentives or rewards as part of service recovery.
Analytics & Intelligence Dashboard	Gives management visibility into customer frustration, risk, recovery performance and retention opportunities.

4. What the Platform Measures

The MVP can capture and analyse data such as:

- Customer segment
- Customer tenure
- Products/services held
- Customer value
- Issue category
- Issue severity
- Number of interactions
- Number of escalations

- Resolution time
- Previous complaints
- Frustration score
- Satisfaction score
- Retention risk
- Recommended intervention
- Reward category
- Reward value
- Reward redemption
- Post-recovery satisfaction
- Retention outcome

Example: A customer with high customer value + high frustration + repeated interactions + delayed resolution would receive a significantly different intervention from a medium-value customer with moderate frustration, a first complaint and quick resolution.

5. User Roles

User	Role in the Platform
Customer	Reports an issue, receives assistance, receives resolution communication, receives a recovery reward and provides post-recovery feedback.
Customer Service Agent	Captures the issue, manages the case, records interactions, escalates where necessary and follows the recommended recovery action.
Relationship Manager / Private Banker	Personally intervenes when a high-value customer presents significant retention risk.
Commercial / Business Relationship Manager	Manages recovery for high-value commercial and SME customers.
CX / Retention Manager	Monitors customer frustration, retention risk, escalations and recovery performance.
Loyalty / Rewards Manager	Configures reward categories, recovery rules, budgets, incentives and reward performance.
Executive / Management	Views strategic intelligence around customer value at risk, retention performance and major sources of customer frustration.
Sanisa Platform Administrator	Configures the platform, rules, integrations, environments, reporting and platform operations.

6. Customer Journey

01 — FRUSTRATION — Customer experiences a problem or service failure.

02 — ASSISTANCE — Customer contacts the organisation and receives support.

03 — RESOLUTION — The issue is resolved and the interaction is recorded.

04 — RECOVERY — The platform determines whether a loyalty intervention is appropriate and recommends the most suitable recovery action.

05 — RETENTION — The customer provides feedback and their subsequent behaviour becomes part of the retention intelligence dataset.

Issue → Assistance → Resolution → Recovery → Loyalty → Feedback → Retention

7. Standard Bank Pilot Concept

For the MVP demonstration, the platform can use **synthetic customer data** to demonstrate how retention intelligence could work across different customer segments.

The three pilot scenarios represent:

1. Private Client
2. Commercial / Business Client
3. Everyday Customer

Important: The pilot scenarios and data are illustrative/synthetic and should not be presented as actual Standard Bank customer data or statistics.

8. Scenario 01 — Private Client

Customer Profile	Example
Segment	Private Client
Relationship	8 years
Products	Current Account, Investments, Credit Card, Home Loan
Monthly Relationship Value	R45,000+
Previous Complaints	1
Frustration	88/100
Retention Risk	High

Customer Frustration

The customer experiences a delay in resolving an investment-related service request. They are transferred between teams and required to follow up multiple times. The matter is ultimately resolved after approximately 72 hours.

Intelligence

Very high customer value + high frustration + multiple interactions + service delays + previous complaint history = **HIGH RETENTION RISK.**

Recommended Recovery

Human intervention + personalised recovery: Relationship Manager intervention, personalised acknowledgement/apology, confirmation of resolution, premium loyalty or lifestyle experience, and post-recovery satisfaction measurement.

Platform Output

Risk: High **Customer Value:** Very High **Recovery Priority:** Critical **Recommended Action:** Senior human intervention + premium loyalty recovery.

Objective

Protect a high-value customer relationship.

9. Scenario 02 — Commercial Client

Customer Profile	Example
Segment	Commercial / SME
Relationship	4 years
Products	Business Account, Merchant Services, Business Lending
Monthly Transaction Value	R800,000
Customer Value	High
Previous Complaints	2
Frustration	76/100
Retention Risk	Medium–High

Customer Frustration

The business experiences a merchant settlement/payment disruption. The issue is resolved within approximately 24 hours, but the disruption affects supplier payments and creates operational pressure.

Intelligence

High commercial value + operational impact + previous complaints + high frustration = **MEDIUM–HIGH RETENTION RISK**.

Recommended Recovery

Business intervention + targeted loyalty benefit: dedicated business support, resolution confirmation, proactive monitoring, fee waiver/credit where appropriate, business-related partner benefit or targeted loyalty reward.

Platform Output

Risk: Medium–High **Customer Value:** High **Recovery Priority:** High **Recommended Action:** Business intervention + targeted recovery benefit.

Objective

Protect revenue and prevent commercial customer movement.

10. Scenario 03 — Everyday Customer

Customer Profile	Example
Segment	Everyday Banking
Relationship	2 years
Products	Current Account + Debit Card
Monthly Spend	R8,500
Customer Value	Medium
Previous Complaints	0
Frustration	62/100
Retention Risk	Medium

Customer Frustration

The customer raises a card transaction dispute. The issue is resolved within the expected SLA, but the customer remains dissatisfied with the process.

Intelligence

Moderate frustration + negative feedback + no previous complaints + medium customer value = **MEDIUM RETENTION RISK**.

Recommended Recovery

Automated recovery + lightweight loyalty intervention: resolution confirmation, thank-you communication, satisfaction check, loyalty points, retail voucher, partner discount or small lifestyle reward.

Platform Output

Risk: Medium **Customer Value:** Medium **Recovery Priority:** Medium **Recommended Action:** Automated recovery + light loyalty intervention.

Objective

Prevent a manageable frustration from becoming future churn.

11. Comparative Intelligence

	Private Client	Commercial Client	Everyday Customer
Customer Value	Very High	High	Medium
Frustration	88	76	62
Retention Risk	High	Medium–High	Medium
Resolution Time	72h	24h	Within SLA
Recovery	Human + Premium	Business + Targeted	Automated + Light
Recovery Cost	High	Medium	Low
Primary Objective	Protect relationship	Protect revenue	Prevent future churn

The Intelligence Difference: The same complaint should not automatically receive the same recovery response. The platform considers the relationship behind the complaint.

12. MVP Data Model

For the pilot, Sanisa can create a synthetic dataset of approximately **100–500 customer cases**.

Field	Example
Customer ID	SB001
Customer Segment	Private
Customer Tenure	8 years
Customer Value	Very High
Product Holding	Investment + Home Loan
Issue Category	Service Delay
Issue Severity	High
Interactions	5
Escalations	2
Resolution Time	72 hours

Field	Example
Previous Complaints	1
Frustration Score	88
Satisfaction Score	42
Retention Risk	High
Recommended Intervention	Human + Premium
Reward Category	Lifestyle
Reward Value	R1,500
Reward Redeemed	Yes/No
Post-Recovery Score	85
Retention Outcome	Retained

13. Management Dashboard

Area	Key Metrics
Customer Intelligence	Customers at risk; customer value at risk; frustration levels; high-value customers experiencing frustration; repeat complaints.
Service Recovery	Open cases; resolution times; escalations; recovery interventions; recovery success.
Loyalty	Rewards issued; rewards redeemed; reward cost; reward performance; recovery reward ROI.
Retention	Recovered customers; post-recovery satisfaction; retention outcomes; high-risk customer trends; top sources of customer frustration.

14. Platform Architecture — MVP

Customer & Interaction Layer

Web | Mobile | WhatsApp | Contact Centre | CRM

Intelligence Layer

Frustration Intelligence | Customer Value | Retention Risk

Decision Layer

Retention Decision Engine

Recovery Layer

Service Intervention | Loyalty Reward | Escalation

Analytics Layer

Retention Dashboard | Customer Insights | Recovery Analytics

Data Layer

Customer Data | Interaction Data | Reward Data | Outcome Data

15. Integration Opportunities

The platform is intended to sit alongside an organisation's existing technology ecosystem rather than replace it.

Potential integrations include:

- CRM platforms
- Customer service/contact-centre systems
- Banking or core business systems
- WhatsApp Business API
- Email
- SMS
- Loyalty platforms
- Reward providers
- Payment systems
- Customer feedback platforms
- Business intelligence tools
- APIs

For the Standard Bank pilot, the initial objective should be to demonstrate the **intelligence and decision layer**, before progressing into deeper production integrations.

16. Future Intelligence

Capability	Purpose
Sentiment Analysis	Automatically identify customer frustration from communication.
Predictive Churn Risk	Identify customers likely to disengage before they leave.
Intelligent Reward Recommendation	Recommend the most appropriate recovery reward based on customer profile and behaviour.
Customer Lifetime Value	Calculate and monitor the financial value associated with retention.
Next-Best Action	Recommend the most effective intervention for each customer.
Recovery ROI	Measure whether the cost of the intervention generated sufficient retention value.

17. Strategic Positioning

Traditional Approach

Customer complains → Company resolves issue → Case closed

Sanisa Approach

Customer complains → Company understands frustration → Customer value is assessed → Retention risk is identified → Appropriate intervention is recommended → Loyalty is used as recovery → Outcome is measured

This moves the organisation from **reactive customer service** to **intelligent customer retention**.

18. The Sanisa Opportunity

The platform creates an opportunity for Sanisa to provide organisations with a new layer of intelligence between **customer experience, service recovery, loyalty and retention**.

Rather than simply rewarding customers for transactions, Sanisa enables organisations to use loyalty as a strategic tool to recover relationships when something goes wrong.

The proposition:

Turn customer frustration into retention.

The platform promise:

Detect. Understand. Intervene. Reward. Retain.

19. Standard Bank Pilot — Demonstration Flow

01 — Customer has a problem

02 — Customer receives assistance

03 — Platform captures the interaction

04 — Engine calculates frustration + customer value + retention risk

05 — Engine recommends the appropriate intervention

06 — Customer receives service recovery

07 — Loyalty reward is triggered where appropriate

08 — Customer provides feedback

09 — Outcome becomes new intelligence

This gives Standard Bank a clear view of **what the platform does, who uses it, what data it consumes, and what business decision it enables**.
